Our knowledge, your imagination. Powerful software.

SureSave

Product Description

SureSave provides peace of mind and protection of having every save go directly to Autonomy iManage WorkSite for nearly all document types opened from WorkSite. This functionality does not require individual applications to be registered with SureSave, as it monitors most documents opened from FileSite or DeskSite and captures every change to the checked out file and extends the save operation back to WorkSite.

The Typical Challenge

Typically, if a user is creating multiple changes to a large document, to ensure that they do not lose their changes, the end user frequently saves their changes. Currently, in WorkSite, when you save a checked-out document, the changes are saved to the user's NRPortbl on their hard drive.

If the user's hard drive crashes, if a virus is obtained, or if anything prevents the document from being checked-in, all edits may be lost.

The SureSave Solution

When a user opens a document in WorkSite, SureSave places the file on its 'watchlist'. Anytime the user performs a save function, the changes made are committed to WorkSite without closing the file.

This functionality is especially useful when you make changes and require other users to immediately see

the revised version as soon as you save the file without the need for you to check-in the document. To continue working, check-out of the document is no longer required.

Save to WorkSite

Perform any save function from most programs in order to allow other users to view edits to your document without having to close and check-in the file first.
