iManage Classify

Mitigate risk & storage costs with semantic enterprise information governance

KEY FEATURES

- Identify types of content
- Rules-based and semantic analysis to understand and classify content
- Ability to tag, comment and enrich data sets

KEY BENEFITS

- Volumes of data reduced to minimize cost of storage, license and data maintenance
- Mitigate risks associated with correct retention of data
- Improved search results

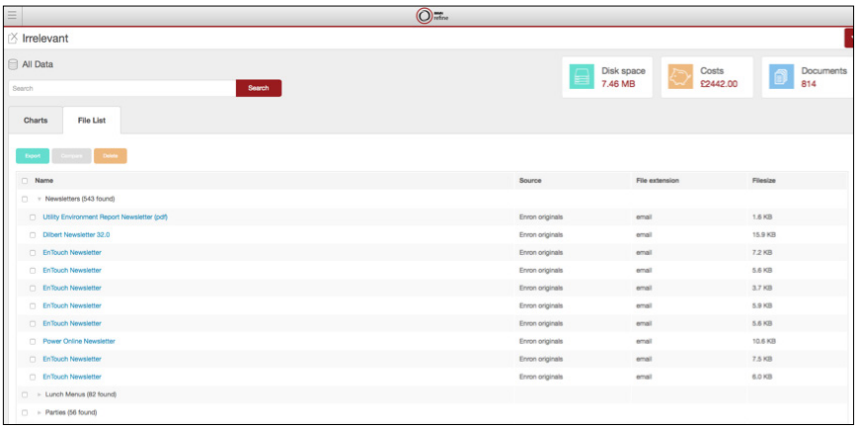
iManage Classify applies AI technology to the management of enterprise-wide data. Whether the business driver is minimizing the cost of storing data or the correct retention for regulatory or compliance reasons, iManage Classify applies a combination of conventional and semantic analyses across content sources to help you take back control of otherwise unchecked expansion.

Discover

Take control of exponential data growth within your organization. Whether simply to minimize the cost of storage or mitigate the risks associated with the correct retention of data, it is fundamental to identify whether content across the enterprise is inactive, duplicated or unwanted.

Classify

Having identified the different types of content, iManage Classify employs a range of techniques ranging from conventional rules-based through to powerful semantic analysis to understand the nature of the content and to correctly classify it accordingly. This is essential for implementing correct policies for retention and data cleansing with the benefit and assurance that you are only paying to store or retain information truly necessary to the business.



Irrelevant Data

Enrich

iManage Classify sits on the iManage RAVN platform, which provides the capability to tag, comment and otherwise enrich data sets. Retaining enriched information relating to the categorized data saves time and provides an audit trail for subsequent data management exercises, even though the data itself is 'managed in place'.

i2 Management Pty Ltd ABN: 14 970 150 874
Level 1, 466 Little Londsdale Street, Melbourne, VIC, 3000

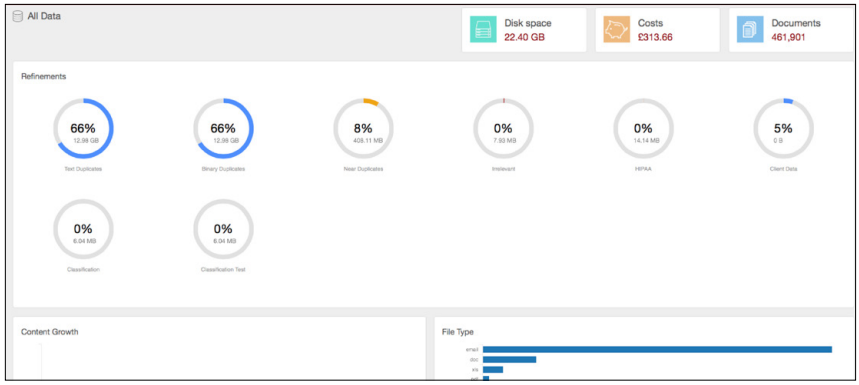
SUPPORTED SYSTEMS:

- iManage Work
- iManage Records Manager
- Network file shares
- Time entry systems
- Agent framework is available for third party integrators



iManage Classify Dashboard

Extend

iManage Classify can potentially reach into any content source in the Enterprise and provide a single interface for the management of data by leveraging the iManage Pipeline connectivity layer. This tried and tested generic framework unifies access to the entire data corpus and powers enterprise-wide perspectives of your information estate, allowing you to plan infrastructures in line with demands and policy.

Reduce the amount of data retained

By identifying exact or near duplicated, expired or trivial data and removing it from the estate, overall data volumes are reduced with associated savings in storage costs, energy costs, licenses and data maintenance overheads.

Risk Mitigation

The risk of not retaining data for compliance reasons often results in overly extended policies. Retaining data beyond expiry policy can equally hold risk to an organization. By applying consistent policies across multiple datasets, iManage Classify can help minimize the risk of secure or sensitive data leaking.

Efficiency

iManage Classify cleanses the resulting datasets of noise, resulting in improved search results and more performant systems due to smaller data volumes to process.
